Advances in Resuscitation Research and Application: 2012 Edition

Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and

foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

CPR/AED for the Professional Rescuer

Neonatal-perinatal medicine has a strong history of evidence based practice but unfortunately there remain many areas of uncertainty and unproven hypotheses and treatments that may harm our highly vulnerable patients. When new ideas are introduced into the labor and delivery room or the NICU we have to evaluate these procedures and therapies before they become accepted as standards of care. We need to learn from the past lessons of grey baby syndrome and chloramphenicol and of kernicterus and sulfonamide antibiotics where therapeutic good intentions

actually did more harm than good and increased the mortality rate of premature babies in the NICU. This proposed edition addresses a broad range of current topics in perinatal neonatal practice. The AAP has just issued new guidelines for the approach to a neonate exposed to maternal genital herpes virus infection. The recommendations were not evidence based and are highly controversial as well as confusing. These topics are addressed in a scholarly and objective manner to both address the controversy and help the practitioner make informed decisions.

BLS for Healthcare Providers

Emergency physicians are usually the first to care for patients with emergency cardiac conditions. They must initiate therapy in a timely manner and must plan care in conjunction with cardiologists, who continue the patient's care. This issue has both emergency physicians and cardiologists as authors, reflecting the fact that both care for patients with cardiac emergencies. Physicians in both disciplines

should benefit from the articles in this issue, resulting in better patient care.

Advanced First Aid, CPR, and AED

The Textbook of Emergency Cardiovascular Care and CPR

The field of cardiothoracic surgery continues to evolve at a rapidly expanding rate. New technologies are under constant development and as patients present with more advanced pathophysiology and complex comorbidities, management becomes more dependent on multi-disciplinary Teams. While there are a variety of innovative and high-profile topics that dominate the literature and the interests of clinicians, sometimes is it the basics both in terms of acute and sometimes unusual problems that often challenge cardiothoracic surgeons on a day to day basis. The goal of Principles and Practice of Cardiothoracic Surgery is to hopefully highlight the current state of the art management of these problems.

2015 Handbook of Emergency Cardiovascular Care for Healthcare Providers

Annual Report

This New American Red Cross CPR/AED for the Professional Rescuer Participant's Manual and course reflect changes based on the 2005 Consensus on Science for CPR and Emergency Cardiovascular Care (ECC) and the Guidelines 2005 for First Aid. Changes to this program and manual include simplifications to many of the CPR skill sequences, which helps improve retention. There have also been changes to help improve the quality of CPR. The integration of CPR skills into the operation of AEDs had changed to help improve survival from sudden cardiac arrest. Professional rescuers are now trained to use AEDs on adults and children. Information has been updated and added to this program to help professional rescuers administer epinephrine, aspirin and fixed-flow-rate oxygen. The skills learned in this course include adult, child and infant rescue breathing, conscious and unconscious choking, CPR, two-rescuer CPR and adult and child AED. Additional training can be added to this course including bloodborne pathogens training and emergency oxygen administration. While the skills and knowledge that professional rescuers use are increasing, this training will help you meet your most important responsibility as a professional rescuer- the responsibility to save lives.
