Foundations of Museum Studies: Evolving Systems of Knowledge

In 1991, a group of researchers chose the term digital libraries to describe an emerging field of research, development, and practice. Since then, Virginia Tech has had funded research in this area, largely through its Digital Library Research Laboratory. This book is the first in a four book series that reports our key findings and current research investigations. Underlying this book series are six completed dissertations (Gonçalves, Kozievitch, Leidig, Murthy, Shen, Torres), eight dissertations underway, and many masters theses. These reflect our experience with a long string of prototype or production systems developed in the lab, such as CITIDEL, CODER, CTRnet, Ensemble, ETANA, ETD-db, MARIAN, and Open Digital Libraries. There are hundreds of related publications, presentations, tutorials, and reports. We have built upon that work so this book, and the others in the series, will address digital library related needs in many computer science, information science, and library science (e.g., LIS) courses, as well as the requirements of researchers, developers, and practitioners. Much of the early work in the digital library field struck a balance between addressing real world needs, integrating methods from related areas, and advancing an ever-expanding research agenda. Our work has fit in with these trends, but simultaneously has been driven by a desire to provide a firm conceptual and formal basis for the field. Our aim has been to move from engineering to science. We claim that our 5S (Societies, Scenarios, Spaces, Structures, Streams) framework, discussed in publications dating back to

at least 1998, provides a suitable basis. This book introduces 5S, and the key theoretical and formal aspects of the 5S framework. While the 5S framework may be used to describe many types of information systems, and is likely to have even broader utility and appeal, we focus here on digital libraries. Our view of digital libraries is broad, so further generalization should be straightforward. We have connected with related fields, including hypertext/hypermedia, information storage and retrieval, knowledge management, machine learning, multimedia, personal information management, and Web 2.0. Applications have included managing not only publications, but also archaeological information, educational resources, fish images, scientific datasets, and scientific experiments/ simulations.

Neal-Schuman Library Technology Companion

Introduces LIS students to the ever-changing world of modern libraries and information centers by providing an important overview of libraries in the era of electronic information.

Information Systems Foundations: Constructing and Criticising

This updated edition of the renowned library management textbook provides a comprehensive overview of the techniques needed to effectively manage a contemporary library or information center.

Search Foundations

Richard Rubin has written a completely revised and updated edition of the first textbook - and most widely-used - specifically written to cover the fundamentals of library and information science. Foundations is the most current teaching resource available, covering the practice of librarianship, the place of libraries in the broader information infrastructure, the development of information science, the growth of information technologies, information policy in libraries, intellectual organization of libraries, the mission of libraries from past to present, and ethical aspects and principles between information providers and clients. The various types of libraries (public, academic, school, and special libraries), their internal functions, and the

major organizational issues they face are discussed. This second edition provides updates of many critical issues and also includes new topics - digital libraries and reference, information infrastructure, the Web, UCITA, Homeland Security, revised intellectual freedom policy statements, digital rights management, file sharing, MARC21, metadata, and much more - that are important to our profession. The extensive lists of selected readings have been thoroughly updated. Library and information science students and professionals will find the background and concepts they need to meet today's - and tomorrow's - challenges in this new edition.

Jesse Shera, Librarianship, and Information Science

Papers presented at the second biennial Information Systems Foundations ('Constructing and Criticising') Workshop, held at The Australian National University in Canberra from 16-17 July 2004. The focus of the workshop was, as for the first in the series, the foundations of Information Systems as an academic discipline. The particular emphasis was on the adequacy and completeness of theoretical underpinnings and the research methods employed.

All Ages Welcome

The Foundations of Education for Librarianship

Into the Future

Designing research can be daunting and disorienting for novices. After experiencing this first hand, author Douglas Woodwell has written *Research Foundations: How Do We Know What We Know?*, a book that shows how to mentally frame research in a way that is understandable and approachable while also discussing some of the more specific issues that will aid the reader in understanding the options available. Stressing the link between research and theory-building, this concise book shows students how new knowledge is discovered through the process of research. The author presents a model that ties together research processes across the various traditions and shows how different types of research interrelate. The book is sophisticated in its presentation, but uses plain language to provide an explanation of higher-level concepts in an engaging manner. Throughout the book, the author treats research methodologies as a blueprint for answering a wide range of interesting questions, rather than simply a set of tools to be applied. The book is an excellent guide for students who will be consumers of research and who need to understand how theory and research interrelate.

The History and Adventures of the Renowned Don Quixote,3

Quantum information has dramatically changed information science and technology, looking at the quantum nature of the information carrier as a resource for building new information protocols, designing radically new communication and

computation algorithms, and ultra-sensitive measurements in metrology, with a wealth of applications. From a fundamental perspective, this new discipline has led us to regard quantum theory itself as a special theory of information, and has opened routes for exploring solutions to the tension with general relativity, based, for example, on the holographic principle, on non-causal variations of the theory, or else on the powerful algorithm of the quantum cellular automaton, which has revealed new routes for exploring quantum fields theory, both as a new microscopic mechanism on the fundamental side, and as a tool for efficient physical quantum simulations for practical purposes. In this golden age of foundations, an astonishing number of new ideas, frameworks, and results, spawned by the quantum information theory experience, have revolutionized the way we think about the subject, with a new research community emerging worldwide, including scientists from computer science and mathematics.

Introduction to Information Retrieval

Research within the Disciplines

"Provides a snapshot of the current state of critical information literacy as it is enacted and understood by academic librarians"--

Introduction to Information Science and Technology

A new edition of a graduate-level machine learning textbook that focuses on the analysis and theory of algorithms. This book is a general introduction to machine learning that can serve as a textbook for graduate students and a reference for researchers. It covers fundamental modern topics in machine learning while providing the theoretical basis and conceptual tools needed for the discussion and justification of algorithms. It also describes several key aspects of the application of these algorithms. The authors aim to present novel theoretical tools and concepts while giving concise proofs even for relatively advanced topics. Foundations of Machine Learning is unique in its focus on the analysis and theory of algorithms. The first four chapters lay the theoretical foundation for what follows; subsequent chapters are mostly self-contained. Topics covered include the Probably Approximately Correct (PAC) learning framework; generalization bounds based on Rademacher complexity and VC-dimension; Support Vector Machines (SVMs); kernel methods; boosting; on-line learning; multi-class classification; ranking; regression; algorithmic stability; dimensionality reduction; learning automata and languages; and reinforcement learning. Each chapter ends with a set of exercises. Appendixes provide additional material including concise probability review. This second edition offers three new chapters, on model selection, maximum entropy models, and conditional entropy models. New material in the appendixes includes a major section on Fenchel duality, expanded coverage of concentration inequalities, and an entirely new entry on information theory. More than half of the exercises are new to this edition.

Library and Information Center Management, 8th Edition

Richard E. Rubin's book has served as the authoritative introductory text for generations of library and information science practitioners, with each new edition taking in its stride the myriad societal, technological, political, and economic changes affecting our users and institutions and transforming our discipline. Rubin teams up with his daughter, Rachel G. Rubin, a rising star in the library field in her own right, for the fifth edition. Spanning all types of libraries, from public to academic, school, and special, it illuminates the major facets of LIS for students as well as current professionals. Continuing its tradition of excellence, this text addresses: the history and mission of libraries from past to present, including the history of service to African Americans; critical contemporary social issues such as services to marginalized communities, tribal libraries, and immigrants; the rise of e-government and the crucial role of political advocacy; digital devices, social networking, digital publishing, e-books, virtual reality, and other technology; forces shaping the future of libraries, including Future Ready libraries, and sustainability as a core value of librarianship; the values and ethics of the profession, with new coverage of civic engagement, combatting fake news, the importance of social justice, and the role of critical librarianship; knowledge infrastructure and organization, including Resource Description and Access (RDA), linked data, and the Library Research Model; the significance of the digital divide and policy issues related to broadband access and net neutrality; intellectual freedom, legal issues, and copyright-related topics; contemporary issues in LIS education such as the ongoing tensions between information science and library science; and the changing character of collections and services including the role of digital libraries, preservation, and the digital humanities. In its newest edition, *Foundations of Library and Information Science* remains the field's essential resource.

The Intellectual Foundation of Information Organization

"A biography of Jesse Hauk Shera, focusing on his role in defining and negotiating the boundaries of library science and information science, followed by a bibliography of his works"--Provided by publisher.

Reference and Information Services

Informed by a large-scale survey of librarians across the spectrum of institution types, this guide will be a true technology companion to readers at all experience levels.

Foundations of Information Ethics

Trained library support staff is critical in assisting the user in locating and interpreting the resources available in libraries. To do so requires the knowledge and practice of library missions and roles in different types of libraries and the delivery of that information to an increasingly diverse clientele. The plethora of resources available today requires that support staff understand and implement the basic principles of information services as well as the responsibility and relationships among library departments and functional areas. *Foundations of Library Services* is both a text for professors who teach in library support staff programs and an introductory reference manual for support staff who work in

libraries. This book will guide the LSS to be able to: Understand the mission and role of the library in its community Be familiar with the ethics and values of the profession, including those of the Library Bill of Rights, the ALA Code of Ethics, freedom of information, confidentiality of library records and privacy issues Know the responsibility and relationships among library departments Practice the basic principles of circulation, including interlibrary loan; current cataloging and classification systems; and acquisitions and collection development policies. Understand how libraries are governed and funded within their organizations or government structures Realize the value of cooperation to enhance services Practice quality customer service Communicate and promote the library's values and services Recognize and respond to diversity in user needs

Foundations of Environmental Ethics

Updated to reflect the latest trends in reference services and the newest sources commonly used for reference work, this long-awaited book offers you a state-of-the-art view of the concepts, theories, and practicalities of reference work today. A host of specialists have contributed to the collection. This new edition includes more detailed discussion of a wider range of reference-related services including interlibrary loan, document delivery, and readers' advisory services. There is also increased attention to ethical issues and a stronger focus on user-centered services, both face-to-face and mediated by technology. In addition, the authors discuss Web sites of significant value to reference services and the impact of the Internet and World Wide Web on reference services. This carefully designed and readable text explains the essential theory and provides the practical knowledge necessary for an initial reference course. Its broad scope and organizational clarity will benefit students and practitioners.

Foundations of Information Security

High-level overview of the information security field. Covers key concepts like confidentiality, integrity, and availability, then dives into practical applications of these ideas in the areas of operational, physical, network, application, and operating system security. In this high-level survey of the information security field, best-selling author Jason Andress covers the basics of a wide variety of topics, from authentication and authorization to maintaining confidentiality and performing penetration testing. Using real-world security breaches as examples, Foundations of Information Security explores common applications of these concepts, such as operations security, network design, hardening and patching operating systems, securing mobile devices, as well as tools for assessing the security of hosts and applications. You'll also learn the basics of topics like:

- Multifactor authentication and how biometrics and hardware tokens can be used to harden the authentication process
- The principles behind modern cryptography, including symmetric and asymmetric algorithms, hashes, and certificates
- The laws and regulations that protect systems and data
- Anti-malware tools, firewalls, and intrusion detection systems
- Vulnerabilities such as buffer overflows and race conditions

A valuable resource for beginning security professionals, network systems administrators, or anyone new to the field, Foundations of Information Security is a great place to start your journey into the dynamic and rewarding field of information security.

Forming and Funding Public Library Foundations

According to 2016 Pew Research Center survey data, Millennials are more likely to have visited a public library in the past year than any other adult demographic. But despite being core library users, millennials and other younger generations are often underrepresented on library boards and library advocacy groups, including Friends groups and Foundations. But you can change that, with the help of this planner's hands-on worksheets, brainstorming activities, checklists, and expert advice. Using this toolkit from United for Libraries you will understand generational differences and commonalities through statistics and analysis of Baby Boomers, Generation X, Millennials and Generation Z/post-Millennials; learn how to navigate the challenges of fundraising with the "debt generations" by persuasively answering the question "what's in it for me?"; master the ABCs of recruitment and retention, tailoring them to fit your library; craft several customized pitches, giving you confidence no matter the situation or audience; discover how to cement buy-in from two key groups, current organization members and your new recruits, thereby ensuring acceptance and enthusiasm all around; work towards defining and managing diversity for your advocacy group; and use tried and true methods for successful onboarding of volunteers, including a Board Member Orientation Checklist and guidance on mentoring. Using this resource, libraries of all kinds will be empowered to grow and strengthen their recruitment, retention, and training of Trustees, Friends, and Foundation members.

Management Basics for Information Professionals

This important survey will be a key text for LIS students and an essential reference work for practitioners.

Foundations of Library and Information Science, Fourth Edition

Integrating the disparate disciplines of descriptive cataloging, subject cataloging, indexing, and classification, the book adopts a conceptual framework that views the process of organizing information as the use of a special language of description called a bibliographic language.

Foundations of Machine Learning

This broad introduction to museums benefits all educators who teach introductory museum studies, addressing the discipline from a holistic, dynamic, and document-centered perspective. • Frames museum studies within an information context and specifically addresses the interests and concerns of librarians • Benefits all educators who teach introductory museum studies, addressing the discipline from a holistic, dynamic, and document-centered perspective • Highlights how museums are embedded in a larger cultural complex that includes libraries, archives, and other information institutions

Introduction to Information Science

"The Encyclopedia of Library and Information Science provides an outstanding

resource in 33 published volumes with 2 helpful indexes. This thorough reference set--written by 1300 eminent, international experts--offers librarians, information/computer scientists, bibliographers, documentalists, systems analysts, and students, convenient access to the techniques and tools of both library and information science. Impeccably researched, cross referenced, alphabetized by subject, and generously illustrated, the Encyclopedia of Library and Information Science integrates the essential theoretical and practical information accumulating in this rapidly growing field."

Introduction to the Library and Information Professions

Research within the Disciplines is designed to help reference librarians – and students studying to become librarians – gain that deeper understanding of disciplinary differences that allows them to comfortably solve information needs rather than merely responding to questions, and practical knowledge about how to work with researchers in a library setting. The book has three chapters that cover the disciplines at the broadest level – humanities, social sciences, and sciences, plus supplemental chapters that focus on associated disciplines (research in history, business, and engineering, research using government sources) and across disciplines (interdisciplinary and critical information literacy). For the second edition of Research within the Disciplines, several chapters have been added that together give a broader and deeper overview of research across all subject areas: research practices of creative and performing artists and of clinical scientists, research in international documents, research strategies for foreign language materials, and visual literacy across the disciplines. Major shifts in technology have been accounted for that have changed how we do research and have expanded the range of resources available to researchers in all disciplines. All of the chapters have been rewritten or heavily revised; this is much more a new book than a new edition.

Foundations of Library and Information Science

Class-tested and coherent, this textbook teaches classical and web information retrieval, including web search and the related areas of text classification and text clustering from basic concepts. It gives an up-to-date treatment of all aspects of the design and implementation of systems for gathering, indexing, and searching documents; methods for evaluating systems; and an introduction to the use of machine learning methods on text collections. All the important ideas are explained using examples and figures, making it perfect for introductory courses in information retrieval for advanced undergraduates and graduate students in computer science. Based on feedback from extensive classroom experience, the book has been carefully structured in order to make teaching more natural and effective. Slides and additional exercises (with solutions for lecturers) are also available through the book's supporting website to help course instructors prepare their lectures.

Theoretical Foundations for Digital Libraries

A landmark textbook on digital libraries for LIS students, educators and practising

information professionals throughout the world. Exploring Digital Libraries is a highly readable, thought-provoking authoritative and in-depth treatment of the digital library arena that provides an up-to-date overview of the progress, nature and future impact of digital libraries, from their collections and technology-centred foundations over two decades ago to their emergent, community-centred engagement with the social web. This essential textbook:

- Brings students and working librarians up to date on the progress, nature and impact of digital libraries, bridging the gap since the publication of the best-known digital library texts
- Frames digital library research and practice in the context of the social web and makes the case for moving beyond collections to a new emphasis on libraries' value to their communities
- Introduces several new frameworks and novel syntheses that elucidate digital library themes, suggest strategic directions, and break new ground in the digital library literature.
- Calls a good deal of attention to digital library research, but is written from the perspective of strategy and in-depth experience
- Provides a global perspective and integrates material from many sources in one place - the chapters on open repositories and hybrid libraries draw together past, present and prospective work in a way that is unique in the literature.

Readership: Exploring Digital Libraries suits the needs of a range of readers, from working librarians and library leaders to LIS students and educators, or anyone who wants a highly readable and thought-provoking overview of the field and its importance to the future of libraries.

Foundations of Information Policy

Evans and new co-author Greenwell pay close attention to management in "new normal" straitened economic conditions and the pervasive impact of technology on a library manager's role.

Quantum Information and Foundations

Foreword by Alan S. Inouye; Afterword by Nancy Kranich The first of its kind, this important new text provides a much-needed introduction to the myriad information policy issues that impact information professionals, information institutions, and the patrons and communities served by those institutions. In this key textbook for LIS students and reference text for practitioners, noted scholars Jaeger and Taylor draw from current, authoritative sources to familiarize readers with the history of information policy; discuss the broader societal issues shaped by policy, including access to infrastructure, digital literacy and inclusion, accessibility, and security; elucidate the specific laws, regulations, and policies that impact information, including net neutrality, filtering, privacy, openness, and much more; use case studies from a range of institutions to examine the issues, bolstered by discussion questions that encourage readers to delve more deeply; explore the intersections of information policy with human rights, civil rights, and professional ethics; and prepare readers to turn their growing understanding of information policy into action, through activism, advocacy, and education. This book will help future and current information professionals better understand the impacts of information policy on their activities, improving their ability to serve as effective advocates on behalf of their institutions, patrons, and communities.

Foundations of Machine Learning

This graduate-level textbook introduces fundamental concepts and methods in machine learning. It describes several important modern algorithms, provides the theoretical underpinnings of these algorithms, and illustrates key aspects for their application. The authors aim to present novel theoretical tools and concepts while giving concise proofs even for relatively advanced topics. Foundations of Machine Learning fills the need for a general textbook that also offers theoretical details and an emphasis on proofs. Certain topics that are often treated with insufficient attention are discussed in more detail here; for example, entire chapters are devoted to regression, multi-class classification, and ranking. The first three chapters lay the theoretical foundation for what follows, but each remaining chapter is mostly self-contained. The appendix offers a concise probability review, a short introduction to convex optimization, tools for concentration bounds, and several basic properties of matrices and norms used in the book. The book is intended for graduate students and researchers in machine learning, statistics, and related areas; it can be used either as a textbook or as a reference text for a research seminar.

Critical Information Literacy

Research Foundations

A call to redirect the intellectual focus of information retrieval and science (IR&S) toward the phenomenon of technology-mediated experience. In this book, Sachi Arafat and Elham Ashoori issue a call to reorient the intellectual focus of information retrieval and science (IR&S) away from search and related processes toward the more general phenomenon of technology-mediated experience. Technology-mediated experience accounts for an increasing proportion of human lived experience; the phenomenon of mediation gets at the heart of the human-machine relationship. Framing IR&S more broadly in this way generalizes its problems and perspectives, dovetailing them with those shared across disciplines dealing with socio-technical phenomena. This reorientation of IR&S requires imagining it as a new kind of science: a science of technology-mediated experience (STME). Arafat and Ashoori not only offer detailed analysis of the foundational concepts underlying IR&S and other technical disciplines but also boldly call for a radical, systematic appropriation of the sciences and humanities to create a better understanding of the human-technology relationship. Arafat and Ashoori discuss the notion of progress in IR&S and consider ideas of progress from the history and philosophy of science. They argue that progress in IR&S requires explicit linking between technical and nontechnical aspects of discourse. They develop a network of basic questions and present a discursive framework for addressing these questions. With this book, Arafat and Ashoori provide both a manifesto for the reimagining of their field and the foundations on which a reframed IR&S would rest.

Managing Creativity

This work is a general and synthetic study of the post-industrial era and its implications for library and information services in the United States. Since Daniel Bell promulgated his post-industrial metaphor in the early 1970s, it has become one of the most dominant metaphors in contemporary America. His ideas on the nature of the era, especially his articulation of what he refers to as the information society have influenced the ways in which government officials, corporate leaders, and citizens think about the future of political, social and economic life in America. This text examines how this influence has also been felt in the library and information field.

Libraries in the Information Age

Trump: The Art of the Deal

"This open access textbook offers a comprehensive introduction to instruction in all types of library and information settings. Designed for students in library instruction courses, the text is also a resource for new and experienced professionals seeking best practices and selected resources to support their instructional practice. Organized around the backward design approach and written by LIS faculty members with expertise in teaching and learning, this book offers clear guidance on writing learning outcomes, designing assessments, and choosing and implementing instructional strategies, framed by clear and accessible explanations of learning theories. The text takes a critical approach to pedagogy and emphasizes inclusive and accessible instruction. Using a theory into practice approach that will move students from learning to praxis, each chapter includes practical examples, activities, and templates to aid readers in developing their own practice and materials."--Publisher's description.

Instruction in Libraries and Information Centers

This landmark textbook takes a whole subject approach to Information Science as a discipline. Introduced by leading international scholars and offering a global perspective on the discipline, this is designed to be the standard text for students worldwide. The authors' expert narrative guides you through each of the essential building blocks of information science offering a concise introduction and expertly chosen further reading and resources. Critical topics covered include: foundations: - concepts, theories and historical perspectives - organising and retrieving information - information behaviour, domain analysis and digital literacies - technologies, digital libraries and information management - information research methods and informetrics - changing contexts: information society, publishing, e-science and digital humanities - the future of the discipline. Readership: Students of information science, information and knowledge management, librarianship, archives and records management worldwide. Students of other information-related disciplines such as museum studies, publishing, and information systems and practitioners in all of these disciplines.

Encyclopedia of Library and Information Science

Exploring Digital Libraries

President Donald J. Trump lays out his professional and personal worldview in this classic work—a firsthand account of the rise of America’s foremost deal-maker. “I like thinking big. I always have. To me it’s very simple: If you’re going to be thinking anyway, you might as well think big.”—Donald J. Trump Here is Trump in action—how he runs his organization and how he runs his life—as he meets the people he needs to meet, chats with family and friends, clashes with enemies, and challenges conventional thinking. But even a maverick plays by rules, and Trump has formulated time-tested guidelines for success. He isolates the common elements in his greatest accomplishments; he shatters myths; he names names, spells out the zeros, and fully reveals the deal-maker’s art. And throughout, Trump talks—really talks—about how he does it. Trump: The Art of the Deal is an unguarded look at the mind of a brilliant entrepreneur—the ultimate read for anyone interested in the man behind the spotlight. Praise for Trump: The Art of the Deal “Trump makes one believe for a moment in the American dream again.”—The New York Times “Donald Trump is a deal maker. He is a deal maker the way lions are carnivores and water is wet.”—Chicago Tribune “Fascinating . . . wholly absorbing . . . conveys Trump’s larger-than-life demeanor so vibrantly that the reader’s attention is instantly and fully claimed.”—Boston Herald “A chatty, generous, chutzpa-filled autobiography.”—New York Post
