It is generally believed that doing science means accumulating empirical data with no or little reference to the interpretation of the data based on the scientist's theoretical framework or presuppositions. Holton (1969a) has deplored the widely accepted myth (experimenticism) according to which progress in science is presented as the inexorable result of the pursuit of logically sound conclusions from unambiguous experimental data. Surprisingly, some of the leading scientists themselves (Millikan is a good example) have contributed to perpetuate the myth with respect to modern science being essentially empirical, that is carefully tested experimental facts (free of a priori conceptions), leading to inductive generalizations. Based on the existing knowledge in a field of research a scientist formulates the guiding assumptions (Laudan et al. , 1988), presuppositions (Holton, 1978, 1998) and "hard core" (Lakatos, 1970) of the research program that constitutes the imperative of presuppositions, which is not abandoned in the face of anomalous data. Laudan

and his group consider the following paraphrase of Kant by Lakatos as an important guideline: philosophy of science without history of science is empty. Starting in the 1960s, this “historical school” has attempted to redraw and replace the positivist or logical empiricist image of science that dominated for the first half of the twentieth century. Among other aspects, one that looms large in these studies is that of “guiding assumptions” and has considerable implications for the main thesis of this monograph (Chapter 2).

The Council of Scientific and Industrial Research (CSIR) is India’s premier organization for Scientific Exploration and Advancement. Funded by the Ministry of Science and Technology, Government of India, this autonomous body conducts research in the fields of Aerospace Engineering, Ocean Sciences, Metallurgy, Leather, Environment Science, etc. A career with CSIR has the potential to make an everlasting impact in the realm of Science and Technology. You will have a golden opportunity to work with some of the best Scientists and Engineers in India. The Council has entrusted the responsibility of conducting CSIR UGC NET in a Computer-based format to the National Testing Agency (NTA)

The concept of observability of entities in physical science is typically analyzed in terms of the nature and significance of a dichotomy between observables and unobservables. In this book, however, this categorization is resisted and observability is analyzed in a descriptive way in terms of the information which one can receive through interaction with objects in the world. The account of interaction and the transfer of information is done using applicable scientific theories. In this way the question of observability of scientific entities is put to science itself. Several examples are presented which show how this interaction-information account of observability is done. It is demonstrated that observability has many dimensions which are in general orthogonal. The epistemic significance of these dimensions is explained. This study is intended primarily as a method for understanding problems of observability rather than as a solution to those problems. The important issue of scientific realism and its relation to observability, however, demands attention. Hence, the implication of the interaction-information account for realism is drawn in terms of the epistemic significance of the dimensions of observability. This amounts to specifying what it is about good observations that make them objective evidence for scientific theories.

The first article in this volume, by Tetu Hirose, is a definitive study of the genesis of Einstein's theory of relativity. Other articles treat topics—theoretical, experimental, philosophical, and institutional—in the history of physics and chemistry from the researches of Laplace and Lavoisier in the eighteenth century to those of Dirac and Jordan in the twentieth century. Contents: The Ether Problem, the Mechanistic World View, and the Origins of the Theory of Relativity (Tetu Hirose); Einstein's Early Scientific Collaboration (Lewis Pyenson); Max Planck's Philosophy of Nature and His Elaboration of the Special Theory of Relativity (Stanley Goldberg); The Concept of Particle Creation before and after Quantum Mechanics (Joan Bromberg); Chemistry as a Branch of Physics: Laplace's Collaboration with Lavoisier (Henry Guerlac); Mayer's Concept of "Force": The "Axis" of a New Science of Physics (P. M. Heimann); Debates over the Theory of Solution: A Study of Dissent in Physical Chemistry in the English-Speaking World in the Late Nineteenth and Early Twentieth Centuries (R. G. A. Dolby); The Rise of Physics Laboratories in Britain (Romualdas Sviedrys); The Establishment of the Royal College of Chemistry: An Investigation of the Social Context of Early-Victorian Chemistry (Gerrylynn K. Roberts) Originally published in 1976. Test-taking is a skill. Just as students learn rules of grammar, they can learn to succeed on standardized tests. The Assessment Strategies series introduces a variety of test-taking tips and strategies. Your students will walk through a battery of test questions and learn to understand the logic behind each approach. Copious examples of multiple-choice, short-answer, and essay questions give plenty of opportunity to gain confidence in test-taking. Assessment Strategies for Science helps middle school students prepare for tests in science as inquiry, Earth and space science, life science, and physical science.

Historical Studies in the Physical Sciences, Volume 7

Even though mathematics and physics have been related for centuries and this relation appears to be unproblematic, there are many questions still open: Is mathematics really necessary for physics, or could physics exist without mathematics? Should we think physically and then add the mathematics apt to formalise our physical intuition, or should we think mathematically and then interpret physically the obtained results? Do we get mathematical objects by abstraction from real objects, or vice versa? Why is mathematics effective into physics? These are all relevant questions, whose answers are necessary to

fully understand the status of physics, particularly of contemporary physics. The aim of this book is to offer plausible answers to such questions through both historical analyses of relevant cases, and philosophical analyses of the relations between mathematics and physics.

Observability and Observation in Physical Science

These essays on the conceptual understanding of modern physics strike directly at some of the principal difficulties faced by contemporary philosophers of physical science. Moreover, they reverberate to earlier and classical struggles with those difficulties. Each of these essays may be seen as both a commentary on our predecessors and an original analytic interpretation. They come from work of the past decade, most from meetings of the Boston Colloquium for the Philosophy of Science, and they demonstrate again how problematic the fundamentals of our understanding of nature still are. The themes

will seem to be familiar but the variations are not only ingenious but also stimulating, in some ways counterpoint. And so once again we are confronted with issues of space and time, irreversibility and measurement, matter and process, hypothetical reality and verifiability, explanation and reduction, phenomenal base and sophisticated theory, unified science and the unity of nature, and the limits of conventionalism. We are grateful for the cooperation of our contributors, and in particular for the agreement of George Ellis and C. F. von Weizsäcker to allow us to use previously published papers.
