No psychological topic is of greater interest to the general public, and to the discipline of psychology as a whole, than intelligence. Laypeople argue at length about who is intelligent, how to become smarter, and what difference IQ makes. Psychologists and other scholars debate the definition of intelligence, the best ways to measure it, and the relation between intelligence and other social virtues, like creativity, or social vices, like criminal behavior. Much controversy has

surrounded the study of intelligence, but few would dispute Richard Herrnstein's claim that the study of intelligence has been one of the greatest successes of 20th century psychology.

## **Biology for AP ® Courses**

Evolution is the central unifying theme of biology. Yet today, more than a century and a half after Charles Darwin proposed the idea of evolution through natural selection, the topic is often relegated to a handful of chapters in textbooks and a few class sessions in introductory biology courses, if covered at all. In recent years, a movement has been gaining momentum that is aimed at radically changing this situation. On October 25-26, 2011, the Board on Life Sciences of the National Research Council and the National Academy of Sciences held a national convocation in Washington, DC, to explore the many issues associated with teaching evolution across the curriculum. *Thinking Evolutionarily: Evolution Education Across the Life Sciences: Summary of a Convocation* summarizes the goals, presentations, and discussions of the convocation. The goals were to articulate issues, showcase resources that are currently available or under development, and begin to develop a strategic plan for engaging all of the sectors represented at the convocation in future work to make evolution a central focus of all courses in the life sciences, and especially into introductory biology courses at the college and high school levels, though participants also discussed learning in earlier grades and life-long learning. *Thinking Evolutionarily: Evolution Education Across the Life Sciences: Summary of a Convocation* covers the broader issues associated with learning about the nature, processes, and limits of science, since understanding evolutionary science requires a more general appreciation of how science works. This report explains the major themes that recurred throughout the convocation, including the structure and content of curricula, the processes of teaching and learning about evolution, the tensions that can arise in the classroom, and the target audiences for evolution education.

## **A Consumer's Guide to Biology Textbooks, 1985**

Do the sciences aim to uncover the structure of nature, or are they ultimately a practical means of controlling our environment? In *Instrumental Biology, or the Disunity of Science*, Alexander Rosenberg argues that while physics and chemistry can develop laws that reveal the structure of natural phenomena, biology is fated to be a practical, instrumental discipline. Because of the complexity produced by natural selection, and because of the limits on human cognition, scientists are prevented from uncovering the basic structure of biological phenomena. Consequently, biology and all of the disciplines that rest upon it—psychology and the other human sciences—must aim at most to provide practical tools for coping with the natural world rather than a complete theoretical understanding of it.
