As the Mississippi and other midwestern rivers inundated town after town during the summer of 1993, concerned and often angry citizens questioned whether the very technologies and structures intended to "tame" the rivers did not, in fact, increase the severity of the floods. Much of the controversy swirled around the

apparent culpability of the U.S. Army Corps of Engineers, the designer and builder of many of the flood control systems that failed. In this book, Todd Shallat probes the origins of the United States' oldest and largest water management agency and explores how the Corps' emphasis on scientific planning cut against the grain of a nation deeply committed to private enterprise and community rights. Combining extensive research with a lively, engaging style, Shallat follows the technological elite of the army from European antecedents through the boom years of river building after the Civil War. He tells the story of monumental construction and engineering fiascoes, public service and public corruption, and the rise of science and the army expert as agents of the state. Information on engineering during the Civil War, the influence of women and family on the political and organizational philosophy of the Corps, and numerous historical illustrations add interesting highlights to the story. Much more than an institutional history, *Structures in the Stream* offers significant insights into American society, which has alternately supported the massive public works projects that are a legacy of our French heritage and opposed them based on the democratic, individualist tradition inherited from Britain. It will provide important reading for a wide audience in environmental and military history, the history of science and technology, policy studies, and American cultural history.

The New Orleans Flood, U.S. Corruption, and Other Types of Disasters In the aftermath of one of the worst disasters in U.S. history, *Words Whispered in Water* tells the story of one woman's fight—against all odds—to expose a mammoth federal agency—and win. It's a horror story, a mystery, and David and Goliath story all in one. In 2005, the entire world watched as a major U.S. city was nearly wiped off the map. The levees ruptured and New Orleans drowned. But while newscasters attributed the New Orleans flood to "natural catastrophes" and other types of disasters, citizen investigator Sandy Rosenthal set out to expose the true culprit and compel the media and government to tell the truth. This is her story. When the protective steel flood-walls broke, the Army Corps of Engineers—with cooperation from big media—turned the blame on natural types of disasters. In the chaotic aftermath, Rosenthal uncovers the U.S. corruption, and big media at root. Follow this New Orleans hero as she exposes the federal agency's egregious

design errors and eventually changes the narrative surrounding the New Orleans flood. In this engaging and revealing tale of man versus nature and man versus man, *Words Whispered in Water* proves that the power of a single individual is alive and well. If you enjoyed books like *The Johnstown Flood*, *Breach of Faith*, or *The Great Deluge*, then *Words Whispered in Water* is your next read!

This informative guidebook lists all campgrounds in the United States built and operated by the U.S. Army Corps of Engineers, including summer and winter campground sites. Especially valuable for RV travelers and campers who are boaters and fishermen, the book includes all campsites with fishing and boating access located on or near lakes or streams managed by the Army Corps of Engineers. The Corps is renowned for keeping well-maintained sites, with inexpensive fees. Many of the campsites listed are in beautiful, little-known locations, too. Individual campground listings contain complete details about camping facilities, amenities, recreational activities available, RV park information, GPS and longitude/latitude information for each lake, and complete, easy-to-follow directions to get to each campground - which can be handy when traveling where internet signals can be difficult to receive. Concise overviews of the Corps of Engineers' projects at many sites are included for those curious about the works at many parks.

The U.S. Army Corps of Engineers (Corps) is responsible for construction, operations, and maintenance of much of the nation's water resources infrastructure. This infrastructure includes flood control levees, multi-purpose

dams, locks, navigation channels, port and harbor facilities, and beach protection infrastructure. The Corps of Engineers also regulates the dredging and filling of wetlands subject to federal jurisdictions. Along with its programs for flood damage reduction and support of commercial navigation, ecosystem restoration was added as a primary Corps mission area in 1996. The National Research Council (NRC) Committee on U.S. Army Corps of Engineers on Water Resources Science, Engineering, and Planning was convened by the NRC at the request of the Corps of Engineers to provide independent advice to the Corps on an array of strategic and planning issues. National Water Resources Challenges Facing the U.S. Army Corps of Engineers surveys the key water resources challenges facing the Corps, the limits of what might be expected today from the Corps, and future prospects for the agency. This report presents several findings, but no recommendations, to the Corps of Engineers based on initial investigations and discussions with Corps leadership. National Water Resources Challenges Facing the U.S. Army Corps of Engineers can serve as a foundational resource for the Corps of Engineers, U.S. Congress, federal agencies, and Corps project co-sponsors, among others.

"This short, illustrated history of the U. S. Army Corps of Engineers provides an overview of the many missions that engineers have performed in support of the Army and the nation since the early days of the American Revolution. A permanent institution since 1802, the U. S. Army Corps of Engineers has effectively and proudly responded to changing defense requirements and has played an integral part in the development of the nation."Engineers have served in combat in all our nation's wars. Throughout the 19th century the Corps built coastal fortifications, surveyed roads and canals, eliminated navigational hazards, explored and mapped the western frontier, and constructed buildings and monuments in the nation's capital."In the 20th century, the Corps became the lead federal flood control agency. Assigned the military construction mission in 1941, the Corps constructed facilities at home and abroad to support the Army and the Air Force. During the Cold War, Army engineers managed construction programs for America's allies, including a massive effort in Saudi Arabia."Today, building on its rich heritage, the Corps is changing to meet the challenges of tomorrow. Our vision calls for us to be a vital part of the Army; the engineer team of choice, responding to our nation's needs in peace and war; and a values-based organization, respected, responsive, and reliable."I hope that readers of the history will gain an appreciation of the military, political, economic, and technological factors that shaped the modern Corps of Engineers. We in the Corps, both soldiers and civilians, are proud of our many contributions to the Army and the nation and look forward with confidence to continued service."Joe N.
