A History of Electricity and Magnetism

A guide for faculty advisers is presented that addresses aspects of the advising process that are often not discussed. Objectives are to accomplish the following: to provide a working definition and theoretical framework for advising, to show with

model conversations the theory in practice, to provide procedures for advisor self-evaluation, and to create a vehicle for discussion of those issues germane to advising. To control sources of confusion in the advising process, attention is directed to assumptions about youth and the advisee and incorporation of the roles of advisor and adult role model. Examples of advisor comments to a student are provided to illustrate the different roles the advisor may assume. Additional topics include: the faculty advising contract, the use of a visual model for planning, ineffective communication and risk-taking, students' verbal competence, unequal relationships, the advisee's right to fail, and informational advising. A model to help the advisors negotiate with their managers concerning an advising contract provides an example of the advisor-manager conversation. A second model, providing a focused conversation between advisor and advisee, illustrates a first meeting. The guide includes comments on major points enclosed in "boxes" and a bibliography. (SW)

Brand Hijack offers a practical how-to guide to marketing that finally engages the

marketplace. It presents an alternative to conventional marketing wisdom, one that addresses industry crises such as media saturation, consumer evolution and the erosion of image marketing. However, following the book's advice will require some untraditional - even counterintuitive - steps. This type of marketing is not for everyone, you must be confident enough to stop clamouring for control and learn to be spontaneous. Brand hijacking relies on a radical concept - letting go.

Anzio

Democratic Republic of the Congo

Anzio, a small town a mere hour's drive from Rome, became a battleground on which both Allies and Germans paid a bloody price. Planned by Churchill as a swift amphibious flanking maneuver, the 1943 battle of Anzio has been viewed by some as one of the most ill-conceived tactical operations of the Allied war effort, and by others as one of the war's singular lost opportunities. Blumenson examines the actions of the men involved, including Churchill, Eisenhower, Clark, and Montgomery, and takes into account records from Allied and German sources.

The classic Danish thriller dubbed 'The First Crime Novel.' The trial of Pastor Søren

Jensen Quist of Vejlbj took place at Aarhus in 1626. The trial centered around the unexplained disappearance in 1607 of a farm laborer named Jesper Hovgaard who was employed at Pastor Quist's rectory. Fifteen years later, in 1622, human remains were unearthed on the grounds of the rectory. The bones were believed to belong to Hovgaard and word soon spread that the Reverend Quist had slaughtered him and tried to conceal the crime. During the police investigation, two local men, who had past animosity toward Quist, testified that they witnessed the cleric murder Hovgaard while in a drunken rage. The Reverend protested his innocence but was found guilty and executed by decapitation on July 20, 1626. In 2006, 'The Rector of Veilbye' was selected for inclusion in the Cultural Canon of Denmark by the Danish Ministry of Culture. During the ceremony, an official declared that, "the style illuminates elegiac pain and discomfort in an eerily intense drama, and the story is difficult to shake off." Renowned Scandinavian critic Søren Baggesen stated "Blicher is not just the first of Danish literature's great storytellers, he is one of the few tragic poets, Danish literature has ever had."

We are beginning to realize the emergence of a new age--the information age. On the one hand, the full dimensions of this new age, if indeed it is such, are unknown. On the other hand, the authors argue that enough is known to conclude that the conduct of war in the future will be profoundly different. Paradoxically, however, they claim that the nature of war will remain basically the same. In this monograph, General Sullivan and Colonel Dubik examine that paradox and draw some inferences from it. When societies and states changed from an agrarian base to an industrial base, the way they made war also changed. Industrial nations furnished their armies with tools very different from those produced by agrarian nations: the machine gun, steam and petroleum powered engines, the railroad, telegraph, radios, aircraft, and much more. Furthermore, industrial armies changed in organization. Their leadership requirements were different and they developed new operational concepts. The nature of war, however, did not change. In spite of the "new" industrial technology, war remained a human endeavor and very much as Carl von Clausewitz described it in the early 18th century; subject to emotion and characterized by death and destruction. Human fears, bravery, sacrifice and courage operated within the realm of fog, friction and uncertainty. Great captains were masters of both the science and art of war. The root causes of war also stayed the same. People, whether heads of states or leaders of other kinds of groups, still started wars as a result of fear, hatred, greed, ambition, revenge or a host of other "nonrational" considerations. The authors of this study suggest that today we stand at what many consider the threshold of the information age, an

age that has already begun to transform the conduct of warfare just as the industrial age did earlier. New weapons systems, organizations, and operational concepts will emerge, just as they did in response to industrialism. No one knows the full details of what the information age will bring, but the authors demonstrate that the future is sufficiently clear to move the Army in the right direction. Also clear is the fact that Clausewitz is still relevant to the study of war because while the conduct of war will change, the nature of war will be the same. This monograph explains the governing concepts of the industrial age and how they affected the concept of war. Then it describes the concepts emerging to govern the information age and suggests ways in which these concepts may affect the conduct of war. Finally, the monograph discusses those steps that the Army is taking to position itself to exploit what are becoming the dominant military requirements of the information age: speed and precision. Specifically, the authors discuss the ways in which the Army has changed its strategic systems over the past several years so that the Army operational and tactical forces will be able to "see" a situation, decide, adapt, and act faster and more precisely than their opponent. These changes will give strategic planners, and operational and tactical commanders, a new set of information age tools to use in theater and on the battlefield. The net result: more flexibility, more versatility, faster decision making, and broader scope of weapons systems at their immediate disposal.

The Book Of Murder

Art imitates life. Or does it? One sleepy Sunday morning in Buenos Aires, the protagonist of Martinez's brilliant new mystery finds himself unexpectedly tangled up in the story of Luciana, a former authors' assistant whom he has not seen for at least ten years, and Kloster, a rival writer - only far more successful; bestselling, in fact. What he discovers will make him question everything he had always believed - taken for granted - about chance and calculation, cause and effect. Luciana is desperate. In the decade since she last had anything to do with either of the writers, nearly all her close family have died, in highly unusual circumstances. And Luciana or her sister could be next. Luciana's convinced that her one-time employer Kloster is behind the deaths, punishing her for her part in the break-up of his marriage in a murderous frenzy of revenge worthy of one of his own prodigiously successful crime novels. But which comes first, murder or novel? Clever and gripping, THE BOOK OF MURDER is a chilling crime story in which the line between fact and fiction suddenly seems blurred.

The Terrible Hours

"Twelve-year-old Jonathan is half-angel, half-demon, and the only one of his kind. But he has no idea of his true identity, and now a rogue archdemon wants him for his own sinister purpose"--

War in the Information Age

After Southeast Asia, analysts and force planners came to the realization that there was a fundamental difference between search and rescue (SAR) in a permissive area and in an area that was not permissive (i.e., under enemy control). This second condition is now called combat search and rescue or CSAR. At the time of Desert Storm, the two forms of rescue were defined thusly: Search and Rescue (SAR): Use of aircraft, surface craft, submarines, personnel, and equipment to locate and recover personnel in distress on land or at sea. Combat Search and Rescue (CSAR): A specialized SAR task performed by rescue-capable forces to effect recovery of distressed personnel from hostile territory during contingency operations or wartime.² The development of this rescue capability has been well established. Dr. Robert Futrell documented our efforts in Korea in *The United States Air Force in Korea, 1950-1953*. His work was followed by Dr. Earl Tilford's *Search and Rescue in South east Asia*, which eloquently chronicled the heroic efforts of the rescue crews in that conflict who brought back literally thousands of airmen. It extensively documented what is now considered the "golden age" of

rescue. This work is meant to follow in those traditions and will focus on our CSAR efforts in the Persian Gulf War of 1991, or more specifically, the period of Operation Desert Storm, 17 January to 28 February 1991. Overall, CSAR in Desert Storm appears to have been a mixed bag. Because of advances in precision weaponry, Global Positioning System (GPS) technology, countermeasures, and training, relatively few coalition aircraft were shot down. Forty-three coalition aircraft were lost in combat, most over high-threat areas. Eighty-seven coalition airmen, soldiers, sailors, and marines were isolated in enemy or neutral territory. Of that total, 48 were killed, one is still listed as missing, 24 were immediately captured, and 14 were exposed in enemy territory. Of those who survived, most landed in areas controlled by enemy troops. Of the few actually rescueable, six were not rescued for a variety of reasons, but primarily because of limitations in CENTAF's ability to locate them accurately and in a timely manner.

Forecasting the Environmental Fate and Effects of Chemicals is the first book to address specifically the issue of forecasting in environmental toxicology and chemistry from a methodological, regulatory and practical perspective. It is becoming increasingly important for environmental toxicologists and chemists to be able to forecast the fate and effects of chemicals by using existing information to predict the future. Providing a unique and timely opportunity for active

researchers and students to obtain in a single volume the 'state of the art' in this expanding field, this text discusses how forecasts can be made by: * using ecotoxicological endpoints at different levels of biological organisation * measuring and modelling chemical fate in biotic and abiotic environments * adopting difference quantitative frameworks Written by an international team of scientists, this text will be essential reading for postgraduate and advance undergraduate students studying ecotoxicology, toxicology, chemistry and environmental statistics aswell as industrial and academic research scientists in environmental toxicology, environmental chemistry and those involved in risk management.

Regarding Roderer

Originally published in 1999 this exceptionally clear and lucid book quickly became the standard overview of what are now called 'governmentality studies'. With its emphasis on the relationship between governmentality and other key concepts drawn from Michel Foucault, such as bio-politics and sovereignty, the first edition anticipated and defined the terms of contemporary debate and analysis. In this timely second edition Mitchell Dean engages with the full textual basis of Foucault's lectures and once again provides invaluable insights into the traditions, methods and theories of political power identifying the authoritarian as well as liberal sides of governmentality. Every chapter has been fully revised and updated to incorporate, and respond to, new theoretical, social and political developments in the field; a new introduction surveying the state of governmentality today has also been added as well as a completely new chapter on international governmentality.

Electronic Circuits: Discrete & Integrated

Pave Low. The term itself generates an image: a dark, wispy night; a low, pulsating rumble approaching from the distance. The rumble becomes a presence, a large helicopter that settles onto the ground amidst the deep darkness. Earnest men of determination spew forth from it. Heavily armed, they quickly set up to collect intelligence, kill enemy troops, rescue downed or isolated friendly personnel, or otherwise conduct a direct action mission. Mission complete, they just as quickly reassemble, reboard the aircraft, and then disappear into the consuming darkness. It is a powerful image—a conjure, if you will—that strikes fear into any enemy of the United States. But the conjure is real. It is a helicopter called the MH-53J/M. That machine is the end result of the evolution of state-of-the-art avionics, communication, and navigation equipment crewed by highly motivated, enthusiastic, and smart young operators well steeped in the principles, heritage, and credo of special operations. It is the classic combination of men and machine. Those aircraft and Airmen were assigned to the US Air Force Special Operations Command (AFSOC), “America's specialized airpower . . . a step ahead in a changing world, delivering special operations power anytime, anywhere.”¹ AFSOC controls a mixed fleet of both rotary and fixed-wing aircraft to facilitate the fulfillment of that mission. However, the single aircraft that, in its day, has best epitomized that role is the Pave Low helicopter. It, perhaps more than any other aircraft, allowed the AFSOC to realize its purpose. But it was not always so. The aircraft themselves were revolutionary combinations of new, more powerful turbine engines with rotarywing aircraft to produce vastly increased lifting power.

Conceptualized, built, and designated for simpler missions, they were immediately swept up into the long war in Southeast Asia. There they proved the efficacy of the aircraft for dangerous rescue missions, for the initiation of a whole new generation of developing avionics and navigation technology, for providing challenging direct support to small special forces teams and indigenous forces inserted behind enemy lines, and for a myriad of other things that heavy-lift helicopters could be assigned to do. In accomplishing all of that, they also trained a whole generation of men who learned of combat along the Ho Chi Minh Trail in Laos and at other places like Quang Tri, South Vietnam; Son Tay, North Vietnam; and Koh Tang Island, Cambodia. After that conflict, those aircraft and men were returned to peacetime locations and duties, and much was forgotten of those dangerous times and missions. However, a cadre of dedicated combat aviators and commanders felt that the aircraft and community of Airmen had much more to give. Foreseeing an ever-dangerous world, they harnessed those aircraft to a series of evolving new technologies that vastly improved the aircraft by giving them the ability to traverse airspace in any weather conditions, day and night, and to avoid enemy threats. That concept was validated in operations in Panama, Kuwait, Iraq, Serbia, Afghanistan, and many more smaller and quieter operations in between. The men and aircraft also showed the larger utilitarian value of the aircraft as, over the years, they were called out many times to provide natural disaster and humanitarian relief from Africa to New Orleans, Louisiana.

In today's business world, competitiveness defines the industrial leading edge. Organizations and businesses of all sizes are adopting Lean manufacturing practices to increase efficiency and address worries about their bottom lines. In a detailed review of this staple of Lean manufacturing, Cellular Manufacturing: Mitigating Risk and Uncertainty outlines how cellular manufacturing can do just that. It demonstrates how this approach can help you and your teams build a variety of products with as little waste as possible. The book begins by presenting a survey of the current state of existing methods that can best be used in the handling of the bottleneck machines and parts problem, which results from the cellular manufacturing system design. It then explores how decision making under risk is used to help the designer select the best cell arrangement in case of probabilistic production volume and maximize the profit imposed by resource capacity constraints. The author then presents a method for the system design of a manufacturing cell that aims for profit maximization over a certain period of time. He also discusses robust design, illustrated with a real application. Put simply, cellular manufacturing integrates machinery and a small team of staff, directed by a team leader, so all the work on a product or part can be accomplished in the same cell eliminating resources that do not add value to the product. A concise yet unique reference, this book incorporates decision making under risk into cellular manufacturing. The text makes the link that ties cellular manufacturing to the

bottom line. It helps you recognize savings opportunities from elimination of downtime between operations, decreased material handling costs, decreased work-in-progress inventory and associated costs, reduced opportunity for handling errors, decreased downtime spent waiting for supplies or materials, and reduced losses from defective or obsolete products.

The Staff Ride

A Biography Of Ezra Cornell, Founder Of Cornell University.

Best Vacation That Never Was

When his electronic warfare plane, call sign Bat 21, was shot down on 2 April 1972, fifty-three-year-old Air Force navigator Icael "Gene" Hambleton parachuted into the middle of a North Vietnamese invasion force and set off the biggest and most controversial air rescue effort of the Vietnam War. After twenty-five years of official secrecy, the story of that dangerous and costly rescue is revealed by a decorated Air Force pilot and Vietnam veteran. Involving personnel from all services, including the Coast Guard, the unorthodox rescue operation claimed the lives of eleven soldiers and airmen, destroyed or damaged several aircraft, and put hundreds of airmen, a secret commando unit, and a South Vietnamese infantry division at risk. It also examines the thorny debates arising from an operation that balanced one man's life against mounting U.S. and South Vietnamese casualties and material losses, the operation's impact on one of the most critical battles of the war, and the role played by search and rescue as America disengaged from that war.

Written so as to be understood by the non-technical reader who is curious about

the origin of all the electrical and electromagnetic devices that surround him, this history also provides a convenient compendium of information for those familiar with the electrical and magnetic fields. The book moves along at a rapid pace, as it must if it is to cover the enormous proliferation of developments that have occurred during the last hundred years or so. The author has struck a workable balance between the human side of his story, introducing those biographical details that help advance it, and its technical side, explaining theories and "how things work" where this seems appropriate. He also achieves a balance in recounting the discovery of basic scientific principles and their technological applications--the myriad of devices and inventions that utilize energy and information in electromagnetic form. Indeed, one of the important themes of the book is the close and reciprocal relationship between science and technology, between theory and practice. Before approximately 1840, the purely scientific investigations of electrical and magnetic phenomena were largely "ad hoc" and observational, and essentially no technology based on them existed. Afterwards, the scientific explorations became more programmatic and mathematical, and technical applications and inventions began to be produced in great abundance. In return, this technology paid its debt to pure science by providing it with a series of measuring instruments and other research devices that allowed it to advance in parallel. Although this book reviews the early discoveries, from the magnetic lodestone and electrostatic amber of antiquity to Galvani's frog's legs and Franklin's kite-and-key of the 1700s, its major emphasis is on the post-1840

developments, as the following chapter titles will confirm: Early Discoveries--Electrical Machines and Experiments with Static Electricity--Voltaic Electricity, Electrochemistry, Electromagnetism, Galvanometers, Ampere, Biot and Savart, Ohm--Faraday and Henry--Direct Current Dynamos and Motors--Improvements in Batteries, Electrostatic Machines, and Other Older Devices--Electrical Instruments, Laws, and Definitions of Units--The Electric Telegraph--The Atlantic Cable--The Telephone--Electric Lighting--Alternating Currents--Electric Traction--Electromagnetic Waves, Radio, Facsimile, and Television--Microwaves, Radar, Radio Relay, Coaxial Cable, Computers--Plasmas, Masers, Lasers, Fuel Cells, Piezoelectric Crystals, Transistors--X-Rays, Radioactivity, Photoelectric Effect, Structure of the Atom, Spectra.

Designing new products and improving existing ones is a continual process. Industrial design engineering is an industrial engineering process applied to

product designs that are to be manufactured through techniques of production operations. Excellent industrial design engineering programs are essential for the nation's industry to succeed in selling useful and ecologically justifiable and usable products on a market flooded with goods and services. This unique text on industrial design engineering integrates basic knowledge, insight, and working methods from industrial engineering and product design subjects. Industrial Design Engineering: Inventive Problem Solving provides a combination of engineering thinking and design skills that give the researchers, practitioners, and students an excellent foundation for participation in product development projects and techniques for establishing and managing such projects. The design principles are presented around examples related to the designing of products, goods, and services. Case studies are developed around real problems and are based on the customer's needs. Industrial engineering is a field with a large and extensive presence in our nation's manufacturing and service industries. From this new book, researchers, practitioners, and students will get an easy access to a wide range of effective industrial engineering tools and techniques in a concise format that will provide in-depth coverage emphasizing new thinking paradigms, tools, techniques, and models for industrial engineering problem solving.
